Jun Giang

Applications Developed

Career Assistant - Live | GitHub

- Job application management system designed to help organize job hunting.
- Performed the role of project manager: duties involed reviewing all incoming code on **GitHub**, tested new code locally on computer before merging to main code, then deployed on both the devlopment and live site on the domain.
- Utilized **AWS** and **Ubuntu** to manage the server site for domain hosting.
- **MySQL** was used to build a database to hold all incoming frontend data.
- Utilized **PHP** to handle client and server communication for taking in data from user and sending back the requested info based on unique accounts.
- Used **React**, **Redux**, and **Materialize CSS** in developing the front end to let the user or guest add job applications they want to track based on form inputs.

Trendy - Live | GitHub

- Mobile-first app focused on keeping up with trending topics in media and food.
- Utilized **HTML5**, **CSS3**, and **JavaScript** to build the front end design and functionality for a quick look at what is popular in food, movies, music, and youtube.
- Topic rankings information was acquired through APIs working with Yelp, iTunes, and YouTube made with **Ajax** calls, then trimmed and constructed with **jQuery**.
- Utilized a responsive design to deliver minimalized information for mobile vertical view, while expanding on content in horizontal orientation or desktop use.

Pokémon Stay - Live | GitHub

- Memory match card game based on the original 151 Pokémon series.
- Used **JavaScript** and **jQuery** to randomize pokemon, then generated them on the DOM for users to match pairs and add them to their persistent collection.
- Employed browser **local storage** to hold each unique client's specific collection that would update when a new match is made and be shown on app start.
- Applied custom **CSS3** animations and multiple nostalgic pokemon sounds and music to create a fun and interactive atmostphere for new users and fans alike.
